

Organic & Recyclable Waste are being thrown into the RORO bins and collected by waste collector.

Composting bins are placed at designated locations within the market. The hawkers are being taught how to segregate the organic waste from the non-recyclable wastes at source.

High Speed Organic Waste Composting

All organic waste bins are checked to ensure no foreign matters other than organic waste before loading into the Bio-Mate machine. Organic waste that are too oily are required to wash away the oil before loading into Bio-Mate machine.

After 24 - 48 hours, compost can be harvested and stored in opened sack for further stabilization (approximately 6 weeks) before allowed to be used as fertilizer.

Bio-Mate Compost will be used for MBKS landscaping beautification projects.
