

• During the past 100 years global sea levels have risen 4 to 8 inches

Burning fuels such as coal, natural gas and oil produces greenhouse gases in excessive amounts.

Greenhouse gases are emissions that rise into the atmosphere and trap the sun's energy, keeping heat from escaping.

The United States was responsible for 20 percent of the global greenhouse gases emitted in 1997.

Most of the world's emissions are attributed to the United States' large-scale use of fuels in vehicles and factories.

Some predictions for local changes include increasingly hot summers and intense thunderstorms.

• Earth's temperature has risen about 1 degree Fahrenheit in the last century. The past 50 years of warming has been attributed to human activity

• Usage of Products contains CFCs

• Car CO₂ Emission

Causes of Global Warming

• Global Warming is referring to the increase in the average temperature of the Earth's in recent decades and the effects are projected to be continued.

• Industrial Pollutions

• Deforestation

• Landfills
